

Tutorial: Skeletonization

This tutorial aims to skeletonize objects with specific tools from mathematical morphology (thinning, maximum ball...).

The different processes will be applied on the following image:

EXERCISE 1. *Hit-or-miss transform*

The hit-or-miss transformation enables specific pixel configurations to be detected. Based on a pair of disjoint structuring elements $T = (T^1, T^2)$, this transformation is defined as:

$$\eta_T(X) = \{x, T_x^1 \subseteq X, T_x^2 \subseteq X^c\} \quad (1)$$

$$= \epsilon_{T^1}(X) \cap \epsilon_{T^2}(X^c) \quad (2)$$

where $\epsilon_B(X)$ denotes the erosion of X using the structuring element B .

1. Implement the hit-or-miss transform.
2. Test this operator with the following pair of disjoint structuring elements:

$$\begin{pmatrix} \begin{array}{|c|c|c|} \hline +1 & +1 & +1 \\ \hline 0 & +1 & 0 \\ \hline -1 & -1 & -1 \\ \hline \end{array} & \left(T^1 = \begin{array}{|c|c|c|} \hline 1 & 1 & 1 \\ \hline 0 & 1 & 0 \\ \hline 0 & 0 & 0 \\ \hline \end{array}, \quad T^2 = \begin{array}{|c|c|c|} \hline 0 & 0 & 0 \\ \hline 0 & 0 & 0 \\ \hline 1 & 1 & 1 \\ \hline \end{array} \right) \end{pmatrix}$$

where the points with +1 (resp. -1) belong to T^1 (resp. T^2).

EXERCISE 2. *Thinning and thickening*

Using the hit-or-miss transform, it is possible to make a thinning or thickening of a binary object in the following way:

$$\theta_T(X) = X \setminus \eta_T(X) \quad (3)$$

$$\chi_T(X) = X \cup \eta_T(X^c) \quad (4)$$

These two operators are dual in the sense that $\theta_T(X) = (\chi_T(X^c))^c$.

1. Implement these two transformations.
2. Test these operators with the previous pair of structuring elements.

EXERCISE 3. *Topological skeleton*

By using the two following pairs of structuring elements with their rotations (90°) in an iterative way, the thinning process converges to a resulting object which is homothetic (topologically equivalent) to the initial object.

+1	+1	+1	0	+1	0
0	+1	0	+1	+1	-1
-1	-1	-1	0	-1	-1

1. Implement this transformation (the convergence has to be satisfied).
2. Test this operator and comment.

EXERCISE 4. *Morphological skeleton*

A ball $B_n(x)$ with center x and radius n is maximum with respect to the set X if there exists neither indice k nor centre y such that:

$$B_n(x) \subseteq B_k(y) \subseteq X$$

In this way, the morphological skeleton of a set X is constituted by all the centers of maximum balls. Mathematically, it is defined as:

$$S(X) = \bigcup_r \epsilon_{B_r(0)}(X) \setminus \gamma_{B_1(0)}(\epsilon_{B_r(0)}(X)) \quad (5)$$

1. Implement this transformation.
2. Test this operator and compare it with the topological skeleton.
